

A croc-tastic activity book from
Florida Power & Light Company

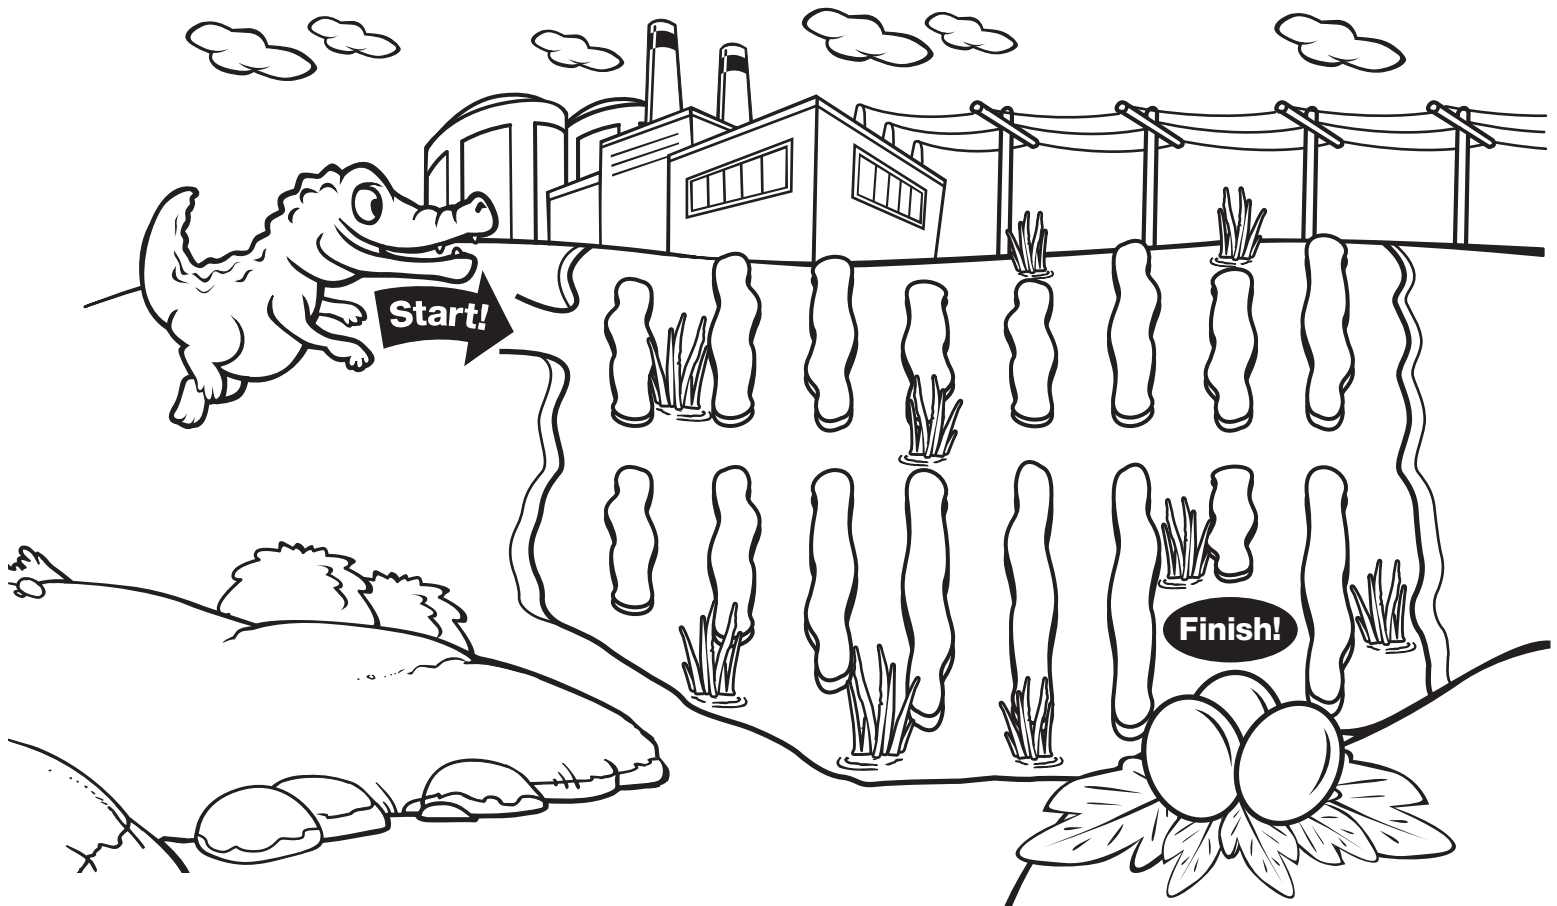

**At the Turkey Point Nuclear Power Plant,
located in Homestead, FL, workers produce
the electricity we use at home.**

**CROC
BITES!**

**Nuclear power plants produce electricity through
a scientific process called nuclear fission.**

Can you help the baby crocodile swim through the cooling canals?

Turkey Point has miles of cooling canals full of water that help produce electricity. The crocodiles love living in and around the canals, that provide a perfect habitat for the reptiles because they are full of food and nesting areas.

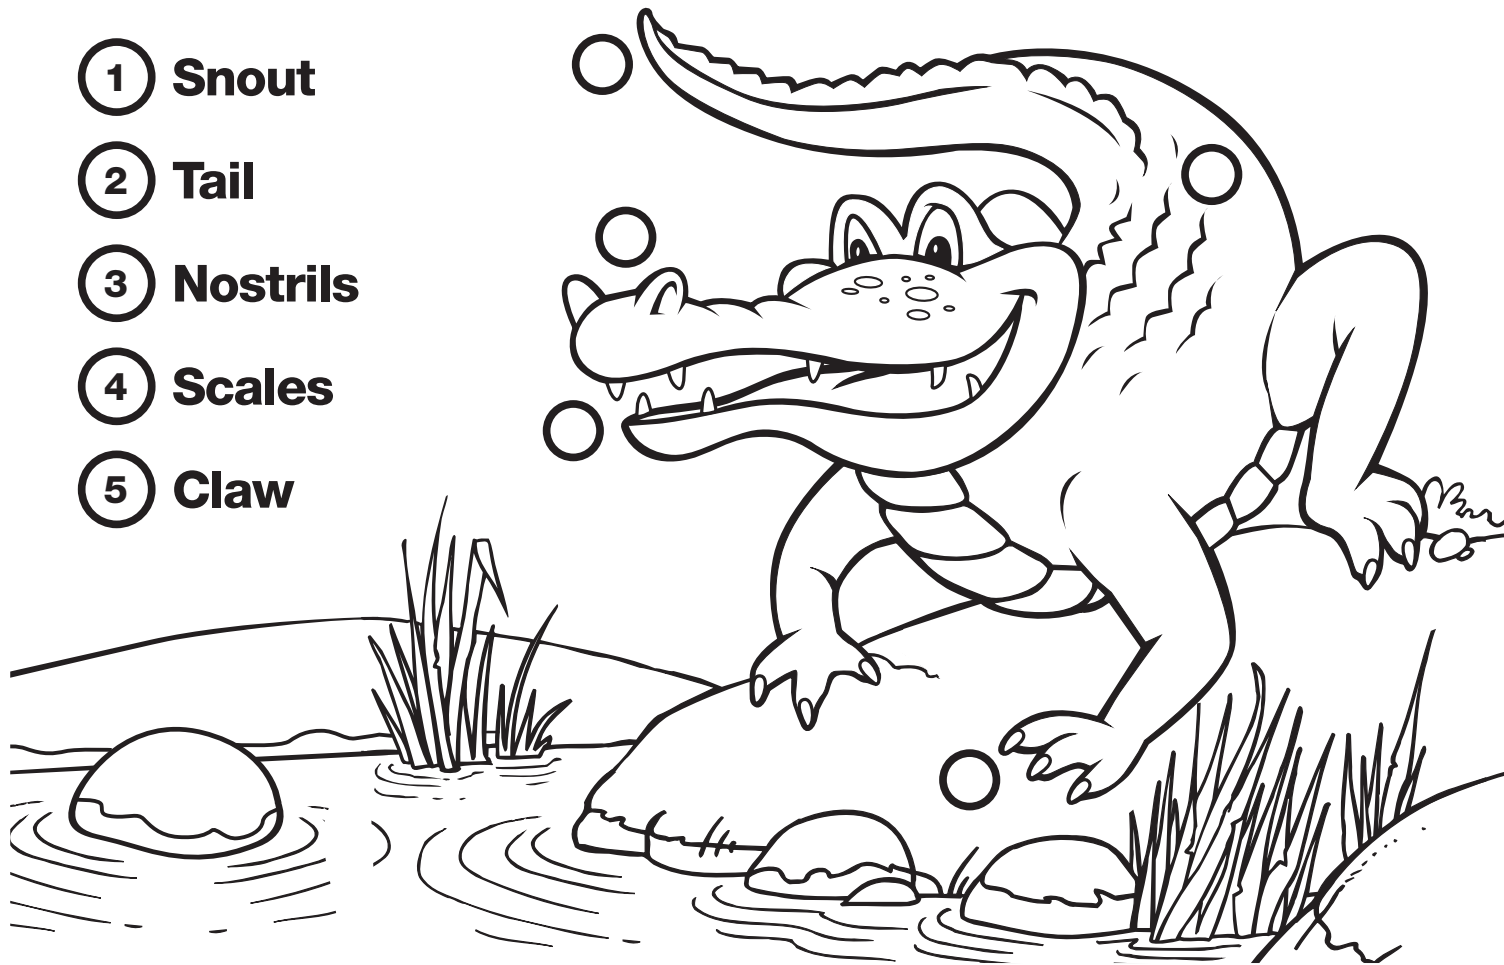

**CROC
BITES!**

Crocodiles are powerful swimmers that use their tail as a propeller.

Hi, I'm an American crocodile! That means I'm a reptile and have scales, lots of teeth, and powerful claws.

Can you name the different parts of my long, scaly body?

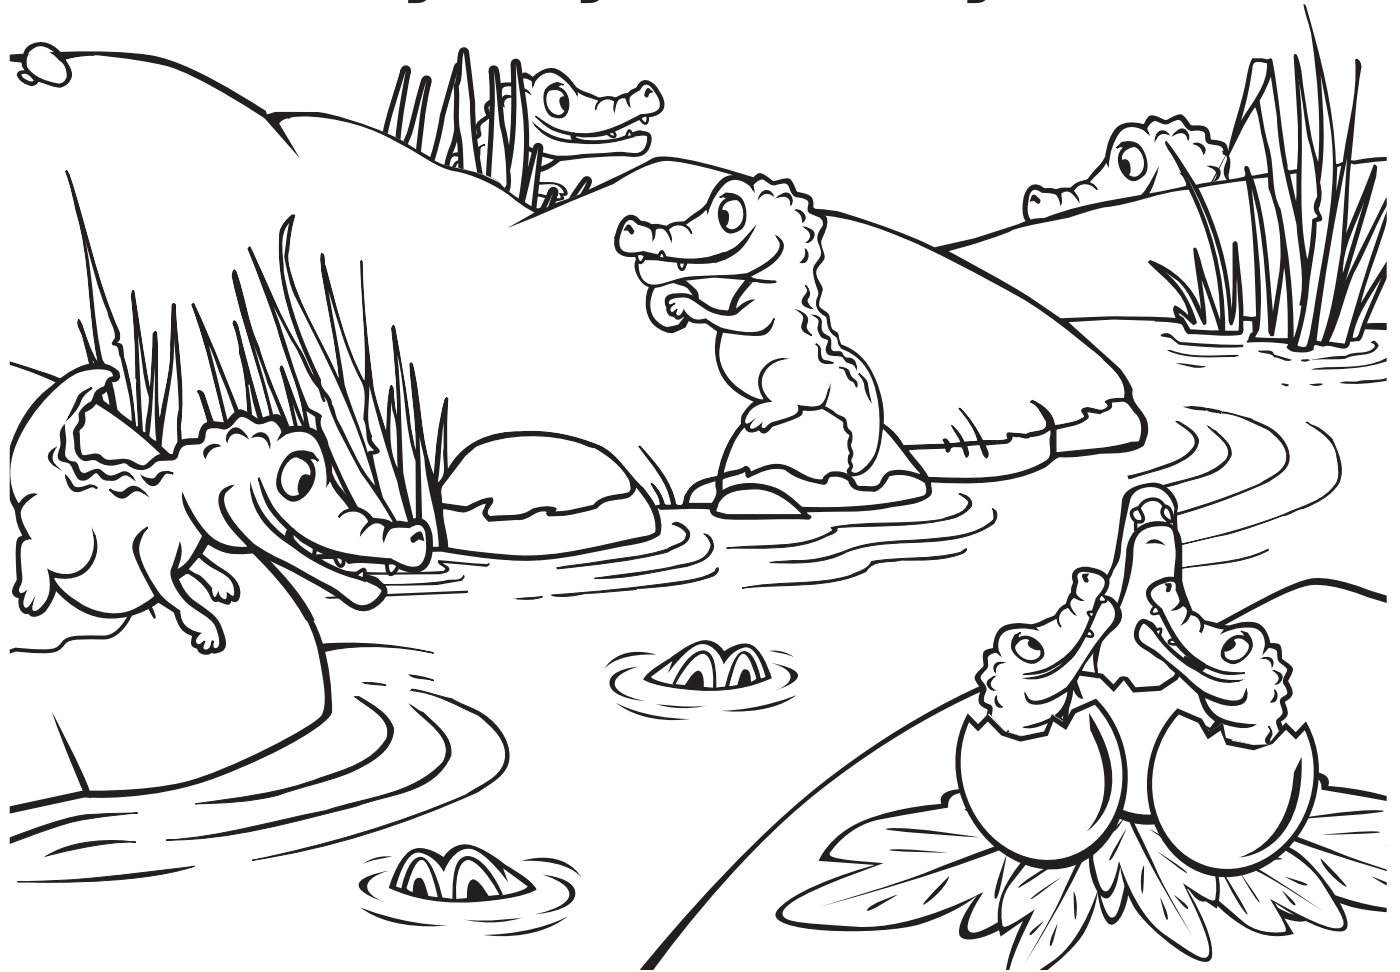

- ① Snout
- ② Tail
- ③ Nostrils
- ④ Scales
- ⑤ Claw

**CROC
BITES!**

Crocodiles have one of the strongest bites in the world, capable of crushing turtle shells like potato chips!

How many baby crocs can you find?

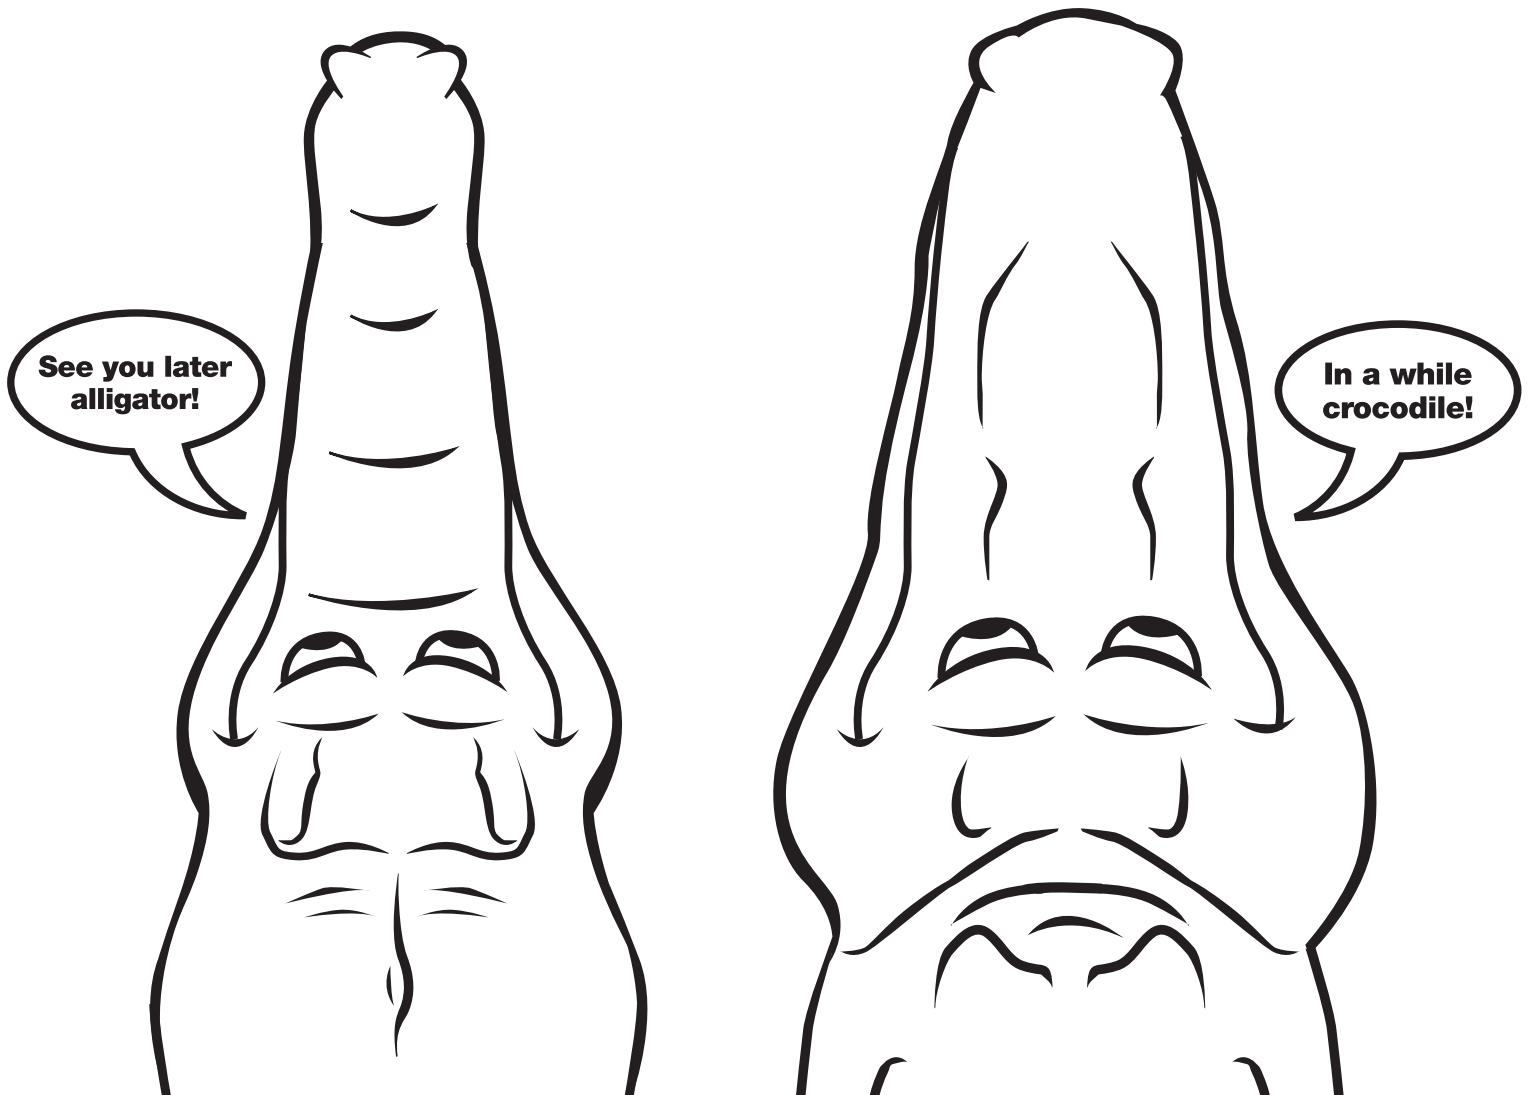

Turkey Point preserves the crocodile species with help from biologists who make sure their habitat stays intact. This helps mommy crocodiles take care of their babies when they hatch from their eggs every summer.

**CROC
BITES!**

Hatchling crocs are born with a tiny egg tooth at the end of their snouts that helps them break free from the egg.

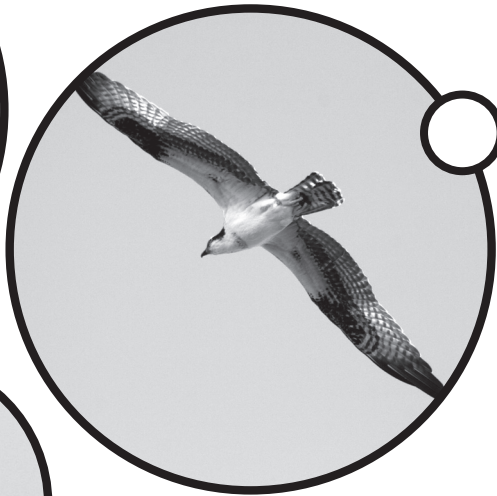

**This is my friend, he is an Alligator.
Look closely and you can see the differences
between crocodiles and alligators.**

**CROC
BITES!**

One way to tell the difference between a crocodile and an alligator is to look at their snouts. Crocs have a pointed snout and alligators have a rounded one...Just don't get too close!

**Other animals live in the cooling canals at Turkey Point.
Can you match each animal with its name?**

- ① Rattle Snake
- ② Osprey
- ③ Heron
- ④ Owl
- ⑤ Deer
- ⑥ Turtle

**CROC
BITES!**

**Crocodiles eat a variety of animals including
fish, birds, and small mammals.**
